

# Package ‘speedglm’

May 6, 2023

**Type** Package

**Title** Fitting Linear and Generalized Linear Models to Large Data Sets

**Version** 0.3-5

**Date** 2023-04-20

**Author** Marco Enea [aut, cre],  
Ronen Meiri [ctb] (on behalf of DMWay Analytics LTD),  
Tomer Kalimi [ctb] (on behalf of DMWay Analytics LTD)

**Maintainer** Marco Enea <marco.enea@unipa.it>

**Depends** Matrix, MASS, biglm

**Imports** methods, stats

**Description** Fitting linear models and generalized linear models to large data sets by updating algorithms, according to the method described in Enea (2009, ISBN: 9788861294257).

**License** GPL

**LazyLoad** yes

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2023-05-06 10:10:02 UTC

 speedglm-package

*Fitting Linear and Generalized Linear Models to Large Data Sets*

---

### Description

Fits Linear and Generalized Linear Models to large data sets. For data loaded in R memory the fitting is usually fast, especially if R is linked against an optimized BLAS. For data sets of size larger than R memory, the fitting is made by an updating algorithm.

### Details

Package: speedglm  
 Type: Package  
 Version: 0.3-5  
 Date: 2023-04-20  
 Depends: Matrix, stats, MASS  
 License: GPL  
 LazyLoad: yes

### Author(s)

Marco Enea <marco.enea@unipa.it>, with contributions from Ronen Meiri and Tomer Kalimi (on behalf of DMWay Analytics LTD).

Maintainer: Marco Enea <marco.enea@unipa.it>

---

 add1.speedlm

*Wrappers to the add1 and drop1 methods for speedlm and speedglm objects*

---

### Description

These are advised to be used for speedlm and speedglm models fitted on moderately large data sets. It is also possible to use [stepAIC](#) function from package MASS.

### Usage

```

## S3 method for class 'speedlm'
## S3 method for class 'speedlm'
add1(object, scope, scale = 0, test = c("none", "Chisq", "F"),
      x = NULL, k = 2, data, ...)
## S3 method for class 'speedlm'

```

```

drop1(object, scope, scale = 0, all.cols = TRUE,
      test = c("none", "Chisq", "F"), k = 2, data, ...)
## S3 method for class 'speedlm'
extractAIC(fit, scale = 0, k=2,...)
## S3 method for class 'speedlm'
nobs(object, use.fallback = FALSE, ...)

## S3 method for class 'speedglm'
## S3 method for class 'speedglm'
add1(object, scope, scale = 0, test = c("none", "LRT",
      "Chisq", "F"), x = NULL, k = 2, ...)
## S3 method for class 'speedglm'
drop1(object, scope, scale = 0, test = c("none", "LRT",
      "Chisq", "F"), k = 2, ...)
## S3 method for class 'speedglm'
extractAIC(fit, scale = 0, k=2,...)
## S3 method for class 'speedglm'
nobs(object, use.fallback = FALSE, ...)

```

## Arguments

object	a speedlm or speedglm object for which model=TRUE was previously set to.
fit	a speedlm or speedglm object
scope	see <a href="#">add1</a> from package stats.
scale	see <a href="#">add1</a> from package stats.
all.cols	see <a href="#">drop1</a> from package stats.
test	see <a href="#">add1</a> from package stats. Currently, test "Rao" is not implemented.
x	see <a href="#">add1</a> from package stats.
k	see <a href="#">add1</a> from package stats.
data	the data that the model was previously fitted to. If not provided, these will be searched in the parent environment.
use.fallback	logical. Should fallback methods be used to try to guess the value?
...	further optional arguments.

## Details

It is possible to use functions `step()` and `stepAIC()` for both `speedlm` and `speedglm` objects but objects fitted using `updateWithMoreData()`.

## Value

An object of classes "anova" and "data.frame" summarizing the differences in fit between the models.

**Warnings**

Note that these functions have been poorly tested and need to be checked out more carefully.

**Author(s)**

Ronen Meiri and Marco Enea

**Examples**

```
set.seed(10)
n <- 50
k <- 3
x <- round(matrix(rnorm(n * k), n, k), digits = 3)
beta <- c(0.05,0.5,0.8,1.3,1.8)
y <- drop(tcrossprod(cbind(1,x,x[,2]*x[,3]),t(beta))) + rnorm(n,,0.2)
colnames(x) <- c("s1", "s2", "s3")
da <- data.frame(y, x)

m0 <- speedlm(y ~ 1, data = da,model=TRUE, y=TRUE)
m0.1 <- add1(m0,scope=~s1+s2+s3, data = da)
m1 <- step(m0,scope=~s1+s2+s3)
m1
```

---

control

*Miscellanea of functions*

---

**Description**

Utility functions for least squares estimation in large data sets.

**Usage**

```
control(B, symmetric = TRUE, tol.values = 1e-7, tol.vectors = 1e-7,
        out.B = TRUE, method = c("eigen", "Cholesky"))
cp(X, w = NULL, row.chunk = NULL, sparse = FALSE)
is.sparse(X, sparselim = .9, camp = .05)
```

**Arguments**

B	a squared matrix.
symmetric	logical, is B symmetric?
tol.values	tolerance to be consider eigenvalues equals to zero.
tol.vectors	tolerance to be consider eigenvectors equals to zero.
out.B	Have the matrix B to be returned?

method	the method to check for singularity. By default is "eigen", and an eigendecomposition of $X'X$ is made. The "Cholesky" method is faster than "eigen" and does not use tolerance, but the former seems to be more stable for opportune tolerance values.
X	the model matrix.
w	a weights vector.
sparse	logical, is X sparse?
sparselim	a real in the interval [0; 1]. It indicates the minimal proportion of zeroes in the data matrix X in order to consider X as sparse eigendec Logical. Do you want to investigate on rank of X? You may set to
row.chunk	an integer which indicates the total rows number compounding each of the first g-1 blocks. If row.chunk is not a divisor of nrow(X), the g-th block will be formed by the remaining data.
camp	the sample proportion of elements of X on which the survey will be based.

### Details

Function `control` makes an eigendecomposition of B according established values of tolerance. Function `cp` makes the cross-product  $X'X$  by partitioning X in row-blocks. When an optimized BLAS, such as ATLAS, is not installed, the function represents an attempt to speed up the calculation and avoid overflows with medium-large data sets loaded in R memory. The results depending on processor type. Good results are obtained, for example, with an AMD Athlon dual core 1.5 Gb RAM by setting `row.chunk` to some value less than 1000. Try the example below by changing the matrix size and the value of `row.chunk`. If the matrix X is sparse, it will have class "dgCMatrix" (the package Matrix is required) and the cross-product will be made without partitioning. However, good performances are usually obtained with a very high zeroes proportion. Function `is.sparse` makes a quick sample survey on sample proportion of zeroes in X.

### Value

for the function `control`, a list with the following elements:

XTX	the matrix product B without singularities (if there are).
rank	the rank of B
pivot	an ordered set of column indices of B with, if the case, the last $rank + 1, \dots, p$ columns which indicate possible linear combinations.

for the function `cp`:

new.B	the matrix product $X'X$ (weighted, if w is given).
-------	---

for the function `is.sparse`:

sparse	a logical value which indicates if the sample proportion of zeroes is greater than <code>sparselim</code> , with the sample proportion as attribute.
--------	--

**See Also**

[eigen](#), [chol](#), [qr](#), [crossprod](#)

**Examples**

```
#### example 1.

n <- 100
k <- 5
x <- round(matrix(rnorm(n*k),n,k),digits=4)
y <- rnorm(n)

# if an optimized BLAS is not installed, depending on processor type, cp() may be
# faster than crossprod() for large matrices.

a1 <- crossprod(x)
a2 <- cp(x,,row.chunk = 50)
all.equal(a1, a2)

#### example 2.1.
x[,2] <- x[,1] + 2*x[,3] # x has rank 9

# estimation by least squares
A <- function(){
  A1 <- control(crossprod(x))
  ok <- A1$pivot[1:A1$rank]
  as.vector(solve(A1$XTX,crossprod(x[,ok],y)))
}
# estimation by QR decomposition
B <- function(){
  B1 <- qr(x)
  qr.solve(x[,B1$pivot[1:B1$rank]],y)
}
a <- A()
b <- B()

all.equal(a,b)

### example 3.
n <- 1000
fat1 <- gl(20,50)
y <- rnorm(n)
da <- data.frame(y,fat1)
m <- model.matrix(y ~ factor(fat1),data = da)
is.sparse(m)
```

---

data1	<i>A toy dataset</i>
-------	----------------------

---

**Description**

The data1 dataset has 100 rows and 4 columns.

**Usage**

```
data(data1)
```

**Format**

A data frame with 100 observations on the following 4 variables.

y a gamma-distributed response variable

fat1 a four-level factor

x1 a numeric covariate

x2 a numeric covariate

**Details**

This is a toy dataset used to show how function shglm works.

**Examples**

```
data(data1)
```

---

predict.speedglm	<i>Predict method for a speedglm object</i>
------------------	---

---

**Description**

summary The method is currently under construction but some functionalities are available.

**Usage**

```
## S3 method for class 'speedglm'  
predict(object, newdata, type = c("link", "response"),  
        na.action = na.pass, ...)
```

**Arguments**

object	an object of class 'speedlgm'.
newdata	An optional data frame with new data or the original data.
type	Type of prediction.
na.action	function determining what should be done with missing values in newdata.
...	further optional arguments

**Details**

If newdata is omitted prediction are based on the data used for the fit only if argument fitted was previously set to TRUE in the speedglm object. Currently the method does not work for function shglm.

**Value**

pred a vector of predictions.

**Author(s)**

Tomer Kalimi and Marco Enea

**See Also**

[speedglm](#)

**Examples**

```
data(data1)
mod <- speedglm(y~x1+x2+factor(fat1), data=data1, family=Gamma(log), fitted=TRUE)
predict(mod)
```

---

predict.speedlm *Predict method for a speedlm object*

---

**Description**

summary The method is currently under construction but some functionalities are available.

**Usage**

mod <- speedglm(y~x1+x2+factor(fat1), data=data1, family=Gamma(log), fitted=TRUE)
predict(mod)
```

---

speedglm

*Fitting Generalized Linear Models for Large Data Sets*

---

**Description**

speedglm and speedglm.wfit fit GLMs to medium-large data sets, that is those storable into the R memory. The highest performances, in terms of computation time, are obtained when R is linked against an optimized BLAS, such as ATLAS. The function shglm is for a data set stored into a file of size greater than the available memory, and takes as argument a function to manipulate connections.

**Usage**

```
## S3 method for class 'data.frame':
speedglm(formula,data,family=gaussian(),weights=NULL,start=NULL,
          etastart=NULL,mustart=NULL,offset=NULL,maxit=25, k=2,
          sparse=NULL,set.default=list(), trace=FALSE,
          method=c('eigen','Cholesky','qr'), model=FALSE, y=FALSE,
          fitted=FALSE,...)

## S3 method for class 'matrix':
speedglm.wfit(y, X, intercept=TRUE, weights=NULL,row.chunk=NULL,
             family=gaussian(), start=NULL, etastart=NULL,
             mustart=NULL, offset=NULL, acc=1e-08, maxit=25, k=2,
             sparselim=.9,camp=.01, eigendec=TRUE, tol.values=1e-7,
             tol.vectors=1e-7, tol.solve=.Machine$double.eps,
             sparse=NULL,method = c('eigen','Cholesky','qr'),
             trace=FALSE,...)

## S3 method for class 'function':
shglm(formula, datafun, family = gaussian(), weights.fo = NULL, start = NULL,
       etastart = NULL, mustart = NULL, offset = NULL, maxit = 25, k = 2,
       chunksize = 5000, sparse = NULL, trace = FALSE, all.levels = FALSE,
       set.default = list(),...)
```

**Arguments**

Most of arguments are the same of [glm](#) or [bigglm](#) but with some difference.

	the same of <code>glm</code> .
<code>formula</code>	a data frame.
<code>datafun</code>	a function which uses connections. See the example below.
<code>family</code>	the same of <code>glm</code> , but it must be specified with brackets.
<code>start</code>	the same of <code>glm</code> .
<code>weights</code>	the same of <code>glm</code> .
<code>weights.fo</code>	weights for the response. It must be specified as a formula (see the example below).
<code>etastart</code>	the same of <code>glm</code> .
<code>mustart</code>	the same of <code>glm</code> .
<code>offset</code>	the same of <code>glm</code> .
<code>intercept</code>	the same of <code>glm</code> .
<code>X</code>	the same of <code>x</code> in <code>glm.fit</code> .
<code>y</code>	the same of <code>glm</code> and <code>glm.fit</code> .
<code>maxit</code>	the same of <code>glm</code> .
<code>k</code>	numeric, the penalty per parameter to be used; the default <code>k = 2</code> is the classical AIC.

<code>trace</code>	logical. Do you want to be informed about the model estimation progress?
<code>sparse</code>	logical. Is the model matrix sparse? By default is NULL, so a quickly sample survey will be made.
<code>chunksize</code>	an integer indicates the number of rows of the data file to read at time.
<code>all.levels</code>	logical, are all factor's levels present in each data chunk?
<code>set.default</code>	a list in which to specify the below parameters.
<code>sparselim</code>	a real in the interval [0, 1]. It indicates the minimal proportion of zeroes in the data matrix X in order to consider X as sparse.
<code>camp</code>	see the function <a href="#">is.sparse</a> .
<code>eigendec</code>	logical. Do you want to check the rank of X? You may set it to false if you are sure that X is full rank.
<code>row.chunk</code>	an integer, see the function <a href="#">cp</a> for details.
<code>acc</code>	tolerance to be used for the estimation.
<code>tol.solve</code>	see the function <a href="#">solve</a> .
<code>tol.values</code>	see the function <a href="#">control</a> .
<code>tol.vectors</code>	see the function <a href="#">control</a> .
<code>method</code>	the method chosen to detect for singularity.
<code>model</code>	logical. If TRUE the model frame will be returned.
<code>fitted</code>	logical. If TRUE the fitted values will be returned.
<code>...</code>	further optional arguments.

### Details

The function `shglm` works like `biglm`, but it checks for singularity and does not impose restrictions on factors. Since during the IWLS estimation `shglm` uses repeated accesses to data file stored, for example, into the hard disk, the estimation time could be very long. Unlike from `glm` or `biglm`, the functions of class 'speedglm' do not use the QR decomposition, but directly solve the equations in the form of Iterative(-ly) (Re-)Weighted Least Squares (IWLS). The memory size of an object of class 'speedglm' is  $O(p^2)$ , where  $p$  is the number of covariates, unless one or more of argument `model`, `y` and `fitted` are set to TRUE. If an optimized BLAS is not installed, an attempt to speed up calculations might be done by setting `row.chunk` to some value, usually less than 1000, in `set.default`. See the function [cp](#) for details.

If the model matrix is (very) sparse, the package `Matrix` could be used. Note that if method 'qr' is chosen, then the qr decomposition will not be applied on matrix X, as in `lm`, but on  $X'WX$ .

### Value

<code>coefficients</code>	the estimated coefficients.
<code>logLik</code>	the log likelihood of the fitted model.
<code>iter</code>	the number of iterations of IWLS used.
<code>tol</code>	the maximal value of tolerance reached.
<code>convergence</code>	a logical value which indicates if convergence was reached.

family	the family object used.
link	the link function used.
df	the degrees of freedom of the model.
XTX	the product $X'X$ (weighted, if the case).
dispersion	the estimated dispersion parameter of the model.
ok	the set of column indices of the model matrix where the model has been fitted.
rank	the rank of the model matrix.
RSS	the estimated residual sum of squares of the fitted model.
aic	the estimated Akaike Information Criterion.
sparse	a logical value which indicates if the model matrix is sparse.
deviance	the estimated deviance of the fitted model.
nulldf	the degrees of freedom of the null model.
nulldev	the estimated deviance of the null model.
ngoodobs	the number of non-zero weighted observations.
n	the number of observations.
intercept	a logical value which indicates if an intercept has been used.
terms	the terms object used.
call	the matched call.
model	Either NULL or, if model was previously set to TRUE, the model frame.
y	Either NULL or, if y was previously set to TRUE, the response variable.
linear.predictors	Either NULL or, if fitted was previously set to TRUE, the fitted values.
offset	the model offset.

### Note

All the above functions make an object of class 'speedglm'.

In the current package version, arguments `start`, `mustart` and `etastart` of function `shglm` have been disabled. These will be restored in future.

speedlm

*Fitting Linear Models to Large Data Sets*

---

## Description

The functions of class 'speedlm' may speed up the fitting of LMs to large data sets. High performances can be obtained especially if R is linked against an optimized BLAS, such as ATLAS.

## Usage

```

# S3 method of class 'data.frame'
speedlm(formula, data, weights = NULL, offset = NULL, sparse = NULL,
        set.default = list(), method=c('eigen','Cholesky','qr'),
        model = FALSE, y = FALSE, fitted = FALSE, subset=NULL, ...)

# S3 method of class 'matrix'
speedlm.fit(y, X, intercept = FALSE, offset = NULL, row.chunk = NULL,
           sparselim = 0.9, camp = 0.01, eigendec = TRUE,
           tol.solve = .Machine$double.eps, sparse = NULL, tol.values = 1e-07,
           tol.vectors = 1e-07, method=c('eigen','Cholesky','qr'), ...)

speedlm.wfit(y, X, w, intercept = FALSE, offset = NULL, row.chunk = NULL,
            sparselim = 0.9, camp = 0.01, eigendec = TRUE,
            tol.solve = .Machine$double.eps, sparse = NULL, tol.values = 1e-07,
            tol.vectors = 1e-07, method=c('eigen','Cholesky','qr'), ...)

# S3 method of class 'speedlm' (object) and 'data.frame' (data)
## S3 method for class 'speedlm'
update(object, formula, data, add=TRUE, evaluate=TRUE,

```

```
subset=NULL, offset=NULL, weights=NULL,...)
```

```
# S3 method of class 'speedlm' (object) and 'data.frame' (data)
updateWithMoreData(object, data, weights = NULL, offset = NULL, sparse = NULL,
  all.levels = FALSE, set.default = list(), subset=NULL,...)
```

## Arguments

Most of arguments are the same of functions [lm](#) but with some difference.

	the same of function <a href="#">lm</a> .
<code>formula</code>	the same of function <a href="#">lm</a> .
<code>weights</code>	the same of function <a href="#">lm</a> .
<code>w</code>	model weights.
<code>intercept</code>	a logical value which indicates if an intercept is used.
<code>offset</code>	the same of function <a href="#">lm</a> .
<code>X</code>	the same of <code>x</code> in function <a href="#">lm</a> .
<code>y</code>	the same of <code>lm</code> , <code>lm.wfit</code> and <code>lm.fit</code> .
<code>sparse</code>	logical. Is the model matrix sparse? By default is <code>NULL</code> , so a quickly sample survey will be made.
<code>set.default</code>	a list in which to specify the parameters to pass to the functions <a href="#">cp</a> , <a href="#">control</a> and <a href="#">is.sparse</a> .
<code>sparselim</code>	a value in the interval $[0, 1]$ . It indicates the minimal proportion of zeroes, in the model matrix <code>X</code> , in order to consider <code>X</code> as sparse.
<code>camp</code>	see function <a href="#">is.sparse</a> .
<code>eigendec</code>	logical. Do you want to investigate on rank of <code>X</code> ? You may set it to false if you are sure that <code>X</code> is full rank.
<code>row.chunk</code>	an integer, see the function <a href="#">cp</a> for details.
<code>tol.solve</code>	see function <a href="#">solve</a> .
<code>tol.values</code>	see function <a href="#">control</a> .
<code>tol.vectors</code>	see function <a href="#">control</a> .
<code>method</code>	the method used to check for singularity. The default is <code>'eigen'</code> . See details
<code>object</code>	an object of class <code>'speedlm'</code> .
<code>all.levels</code>	are all levels of eventual factors present in each data chunk? If so, set <code>all.levels</code> to true to speed up the fitting.
<code>model</code>	logical. Should the model frame be returned?
<code>fitted</code>	logical. Should the fitted values be returned?
<code>subset</code>	the same of function <a href="#">lm</a>
<code>add</code>	logical. Are additional data coming from a new chunk provided?
<code>evaluate</code>	logical. If true evaluate the new call else return the call.
<code>...</code>	further optional arguments.

## Details

Unlikely from `lm` or `biglm`, the functions of class 'speedlm' do not use the QR decomposition of the X-matrix, but directly solve the normal equations. In some extreme case, this might have some problem of numerical stability, but it may take advantage from the use of an optimized BLAS. To check for singularity, three options are available. Method "eigen" performs an eigendecomposition of  $X'X$ . The 'Cholesky' method is faster than "eigen" and does not use tolerance, but the former seems to be more stable for opportune tolerance values. Method 'qr' does not perform a QR decomposition directly on matrix X, but on  $X'WX$ . The memory size of an object of class 'speedlm' is  $O(p^2)$ , where  $p$  is the number of covariates. If an optimized BLAS library is not installed, an attempt to speed up calculations may be done by setting `row.chunk` to some value, usually less than 1000, in `set.default`. See the function `cp` for details. Factors are permitted without limitations. In the most recent versions, function `update.speedlm` is now a wrapper to call either `updateWithMoreData` (the new name of the old `update.speedlm`, for additional data chunks), or `update` from package `stats`.

## Value

<code>coefficients</code>	the estimated coefficients.
<code>df.residual</code>	the residual degrees of freedom.
<code>XTX</code>	the product $X'X$ (weighted, if the case).
<code>A</code>	the product $X'X$ (weighted, if the case) not checked for singularity.
<code>Xy</code>	the product $X'y$ (weighted, if the case).
<code>ok</code>	the set of column indices of the model matrix where the model has been fitted.
<code>rank</code>	the numeric rank of the fitted linear model.
<code>pivot</code>	see the function <code>control</code> .
<code>RSS</code>	the estimated residual sums of squares of the fitted model.
<code>sparse</code>	a logical value indicating if the model matrix is sparse.
<code>deviance</code>	the estimated deviance of the fitted model.
<code>weights</code>	the weights used in the last updating.
<code>zero.w</code>	the number of non-zero weighted observations.
<code>nobs</code>	the number of observations.
<code>nvar</code>	the number of independent variables.
<code>terms</code>	the terms object used.
<code>intercept</code>	a logical value which indicates if an intercept has been used.
<code>call</code>	the matched call.
<code>model</code>	Either NULL or the model frame, if <code>model</code> was previously set to TRUE.
<code>y</code>	Either NULL or the response variable, if <code>y</code> was previously set to TRUE.
<code>fitted.values</code>	Either NULL or the fitted values, if <code>fitted</code> was previously set to TRUE.
<code>offset</code>	the model offset.
<code>...</code>	others values necessary to update the estimation.

**Note**

All the above functions make an object of class 'speedlm'.

summary.speedglm

*Methods to summarize Generalized Linear Models fits*

---

## Description

summary method for the class 'speedglm'.

## Usage

```

## S3 method for class 'speedglm'
summary(object,correlation=FALSE,...)
## S3 method for class 'speedglm'
coef(object,...)
## S3 method for class 'speedglm'
vcov(object,...)
## S3 method for class 'speedglm'
logLik(object,...)
## S3 method for class 'speedglm'
AIC(object,...)

```

**Arguments**

object	an object of class 'speedglm'.
correlation	logical. Do you want to print the correlation matrix? By default it is false.
...	further optional arguments

**Value**

coefficients	the matrix of coefficients, standard errors, z-statistics and two-side p-values.
df.residual	the component from object.
df.null	the component from object.
null.deviance	the component from object.
deviance	the component from object.
family	the component from object.
call	the component from object.
AIC	the Akaike Information Criterion.
RSS	Residuals sums of squares.
correlation	(only if correlation is true.) The correlations of the estimated coefficients.
logLik	the log-likelihood value.
rank	the component from object.
dispersion	the estimated dispersion parameter of the fitted model.
convergence	the component from object.
iter	the component from object.
tol	the component from object.

summary.speedlm      *Methods to summarize Linear Models fits*

---

## Description

summary method for class 'speedlm'.

## Usage

```
## S3 method for class 'speedlm'
summary(object, correlation = FALSE, ...)
## S3 method for class 'speedlm'
coef(object, ...)
## S3 method for class 'speedlm'
vcov(object, ...)
## S3 method for class 'speedlm'
logLik(object, ...)
## S3 method for class 'speedlm'
AIC(object, ..., k = 2)
```

## Arguments

object	an object of class 'speedlm'.
correlation	logical. Do you want to print the correlation matrix? By default it is false.
k	numeric, the penalty per parameter to be used; the default k = 2 is the classical AIC.
...	further optional arguments

## Value

coefficients	the matrix of coefficients, standard errors, t-statistics and two-side p-values.
rdf	degrees of freedom of the fitted model. It is a component from object.
call	the component from object.
r.squared	R <sup>2</sup> , the fraction of variance explained by the model.
adj.r.squared	the "adjusted" R <sup>2</sup> statistic, penalizing for higher p.
fstatistic	(for models including non-intercept terms) a 3-vector with the value of the F-statistic with its numerator and denominator degrees of freedom.
f.pvalue	p-value of the F-statistic.
RSS	Residual sum of squares.
var.res	estimated variance of residuals.
rank	the component from object.
correlation	(only if correlation is true) the correlations of the estimated parameters.
...	the results from the functions logLik, AIC and vcov.
